

Building a Living Portfolio.

Moving beyond static templates to build a tactile,
high-performance interactive experience.

CREATOR

Ritvik Chunamari

DISCIPLINE

Product & Interactive Design

Not Another Template

Most design portfolios look identical. I wanted the portfolio itself to be proof of craft.

01

Tactile & Alive

Interactive canvas physics that react to user movement and mouse speed.

02

Silky Smooth

Locked at 120fps with zero scroll stutter or frame drops.

03

Fully Shipped

A real, live web app with interactive case studies and an ATS resume.

What I Actually Built

Four core systems working together in the browser.

SYSTEM 01

Antigravity Canvas

Custom 2D physics engine for floating background particles.

SYSTEM 02

Swiss Typography

Bold headline sizing that fills the screen on any device.

SYSTEM 03

4 Deep Dives

Case studies for USPS, Nexus AI, SOC UX, and Olympics 2028.

SYSTEM 04

ATS Resume PDF

Automated 2-page vector resume with 100% recruiter readability.

Where It Broke

Figma mockups are easy. Real browsers gave me three big headaches.

× PROBLEM 01

Severe Scroll Stutter

Adding 3D card tilt dropped scroll speeds below 30fps. It felt laggy and unpolished.

× PROBLEM 02

Mobile Touch Conflict

The cursor particles got in the way of mobile thumb scrolling and drained battery.

× PROBLEM 03

Name Wrapping

On small iPhone screens, "Chunamari" broke awkwardly onto a third line.

How I Fixed It

Simplifying the code made the design look and feel 10x better.

✓ SOLUTION 01

Zero-Render Scroll

Removed 3D tilts and tied scroll to hardware frames. Locked in smooth 120fps.

✓ SOLUTION 02

Touch Soft-Fade

Particles gracefully fade out on touch, leaving mobile gestures completely natural.

✓ SOLUTION 03

Fluid Math

Used CSS clamp formulas so "Ritvik" and "Chunamari" fit edge-to-edge on any screen.

What I Learned

Two big lessons from building with code instead of just Figma.

LESSON 01

Performance IS Design.

A gorgeous effect is useless if it stutters.
Fluidity and speed communicate quality
faster than any visual graphic ever will.

LESSON 02

Restraint Over Noise.

It's tempting to add every fancy animation.
The best decision was deleting the 3D clutter
so the actual work could stand out.

Where I Want Your Help

Try it live on your laptop or phone: ritvikchunamari.github.io

QUESTION 01

Does the cursor feel playful or distracting?

Looking for: Is the physics effect fun, or does it get in the way of reading?

QUESTION 02

Does mobile feel as premium as desktop?

Looking for: Does the typography hold the same personality without the cursor?

QUESTION 03

Are the case studies quick to scan?

Looking for: Do the key metrics and takeaways pop out in under 30 seconds?
